

**THE SURGICAL SOLUTION OF PRESSURE SORES AND TNP THERAPY\***

Milada Franců

*University Hospital, Brno, Czech Republic*

**Aim:** The purpose of this study was to define indications for possible procedures of pressure sores based on the analysis of retrospective data /429 hospitalisations/

**Methods:** Retrospective study using the dates of patients with pressure sores /III. and IV gr/.obtained during the hospitalisations /necrectomy, reconstructions using flaps and TNP therapy\*.

**Results:** The occurrence of relaps is statistically more significant in males with a longer time of first hospitalisation and decrease of number of relaps is statistically more significant when we used two stage operation and TNP therapy\* in the period after necrectomy and before reconstruction.

**Conclusion:** The relaps occurrence did not depend on age, type of operation solution or finishing treatment of patient in the word, either on whether ischial locatisation was involved. But we can describe positive effect using two stage treatment in combination with TNP Therapy\*.

**Discussion:** The results of presented study we can use as a basis for continued monitoring of this area.
